

## Assistants API tools Beta

 Copy page

Explore tools for file search, code, and function calling.

Assistants created using the Assistants API can be equipped with tools that allow them to perform more complex tasks or interact with your application. We provide built-in tools for assistants, but you can also define your own tools to extend their capabilities using Function Calling.

The Assistants API currently supports the following tools:

-  **File Search**  
Built-in RAG tool to process and search through files
-  **Code Interpreter**  
Write and run python code, process files and diverse data
-  **Function Calling**  
Use your own custom functions to interact with your application
